

1, Explain behaviour of hub device

- * It is use to connect multiple network device.
- * It is a broadcast device.
- * It does not understand MAC address.
- * It simply repeats to received signal to other ports

2, Explain behaviour of switch device

- * It is use to connect multiple network device
- * It checks the source mac address
- * It learns the source mac and stores it in the mac address table.
- * It check the destination mac address.
- * If the destination MAC is known it forward otherwise it broadcast.

3, Explain behaviour of router device

- * It is use to breaks broadcast domain
- * It is unicast device.
- * It contains routing table.
- * Routing table contain list of route.
Network ID / Prefix length / Interface name.
- * It understand only IP address.
- * Routing table - Stores information about available network and paths.
